

BATTERY WARRANTY INFORMATION

Battery failure due to reduced vehicle usage

A period of short, infrequent journeys or a length of time when a vehicle is not being used can cause its battery to fail rapidly. This is because:

- A battery is an electrochemical device which naturally loses charge over time.
- It loses charge faster in higher spring and summer temperatures
- Alarms and electrical systems will drain it, even when the vehicle is turned off.
- Shorter, infrequent journeys will take more charge away than the alternator is able to replace.
- Over time it will drain more deeply causing failure due to internal battery damage (Sulphation and acid stratification).

This type of failure is service related and not due to a manufacturing defect.
It is not covered by the battery's warranty.
